SAMUEL FAN / PRODUCT & INTERACTION DESIGN / SYDNEY

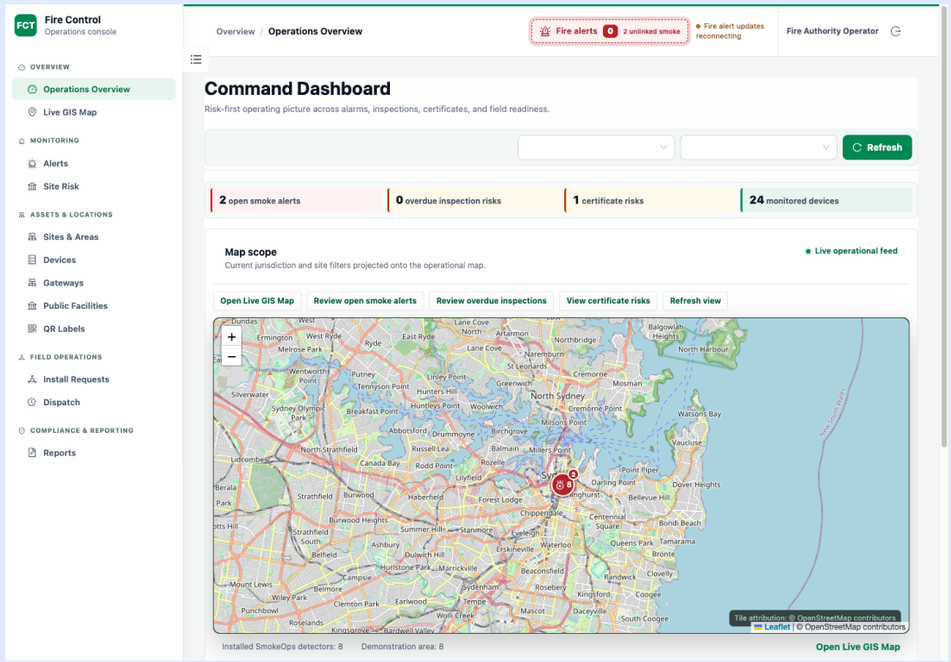

Product judgement. A clear next step.

PRIMARY COMPANY PROJECT

Fire Equipment Management.

My role: requirements, interaction review and test/build coordination.

Team outcome: five people / four-month delivery phase

Accepted team UI · Fictional demonstration data
Public basemap © OpenStreetMap contributors

SUPPORTING WORK

Smart Livestock Monitoring

Field research · UI · AI-assisted Android MVP

One System, One Journey

Figma interface design · Academic team concept

fanxin0528@gmail.com · 0416358898 · Sydney, Australia

Make the next action clear.

Connect owners, inspectors and administrators across field-work handoffs.

MY ROLE

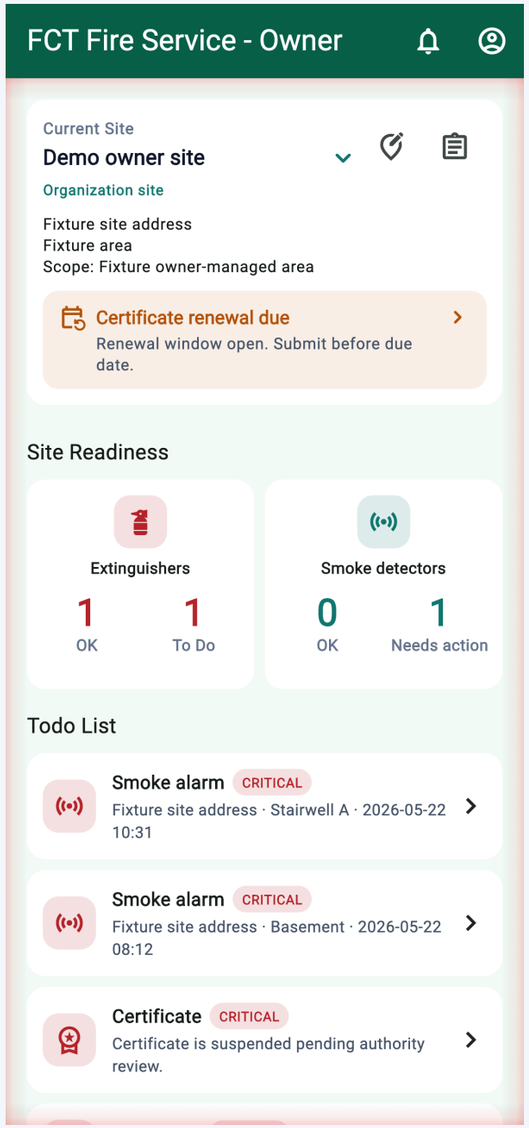

Requirements clarification
Interaction review
Test/build coordination

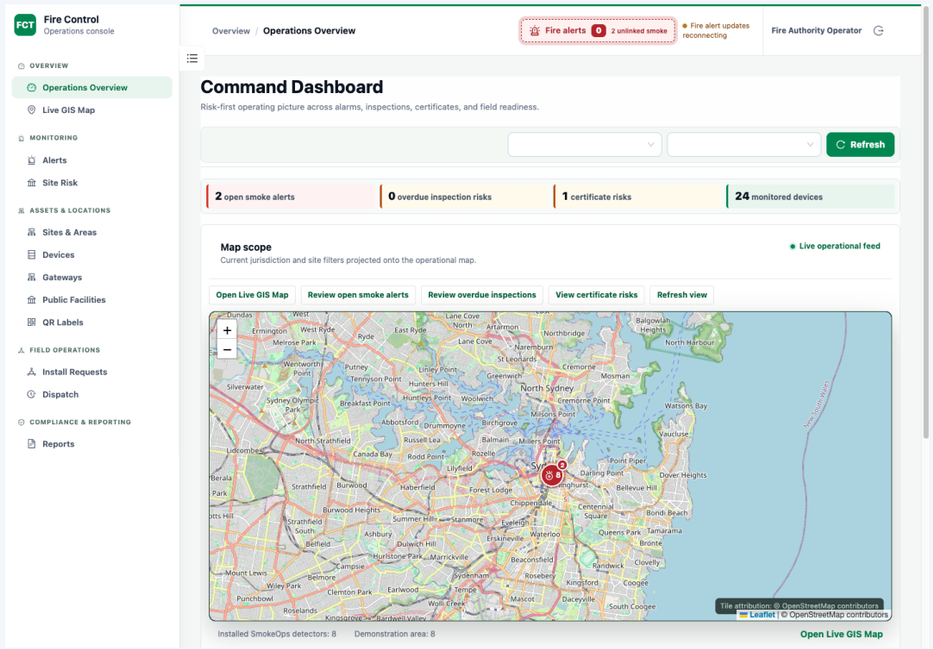

TEAM OUTCOME

Five-person team
Four-month delivery phase

The CTO initially estimated 22 people for comparable scope. This is a team delivery comparison, not a measured productivity result.

Company project / 2026–Present
Delivery and ongoing iteration

ACCEPTED TEAM INTERFACES

Local demonstration data. My contribution is product direction and review with engineering and AI-assisted implementation, not sole screen or code authorship.

Public Sydney basemap © OpenStreetMap contributors. Fictional point and counts.

Separate identity, site and responsibility.

One owner can manage several premises; the next role needs a visible outcome.

ACCOUNT / SITE MODEL

Who signs in

Owner identity + access

Site A

Equipment · Inspection · Certificate

Site B

Another premises; its own work

My contribution: prepared overseas questions, proposed multi-site ownership and clarified account/site boundaries and installation responsibilities.

CROSS-ROLE HANDOFF

Owner establishes site

Premises and equipment define the work.

Parallel field-work paths

Installation → progress review
Inspection → accept, inspect, submit

Admin + owner

Review the outcome and continue follow-up.

I reviewed unreachable paths, interrupted acceptance flows and tasks that still appeared open elsewhere. Installation and inspection are not a mandatory sequence.

Anonymised reconstructions from recorded requirements and review direction; fictional sites.

Keep the task moving.

Acceptance should continue into field work; dispatch should not imply incident closure.

OBSERVED FRICTION REQUESTED DIRECTION

Acceptance interrupted the task

Read → accept → return to list → find the task again

Continue from acceptance

Read assignment → accept → continue inspection

Recorded review feedback reconstructed as text, not original wireframes or a measured before/after usability result.

Make the status explain the issue

I requested specific wording with consistent severity colours. Illustrative copy direction: “Warning” → “Expires within 30 days”.

Narrow the first dispatch workflow

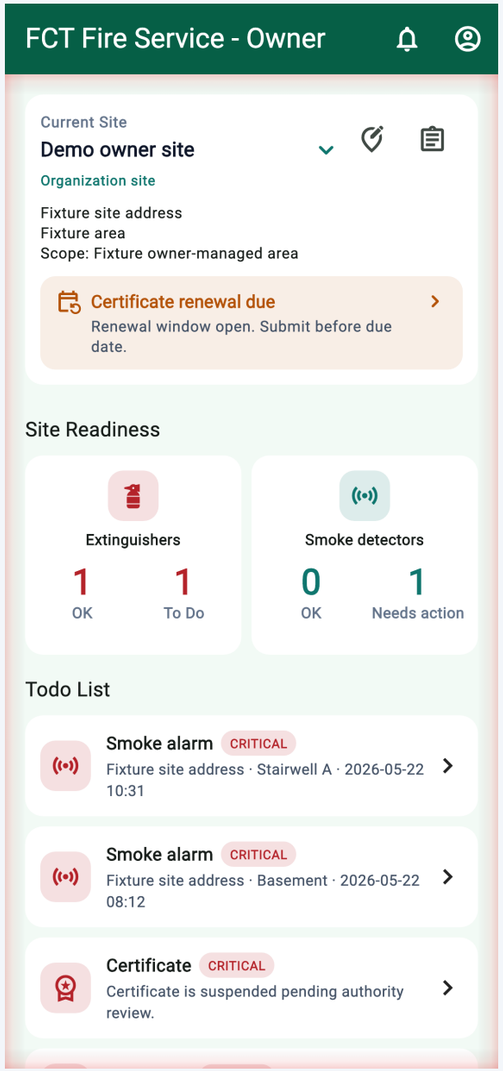

I challenged a long reporting sequence before dispatcher needs were established; the first workflow should confirm the responding unit.

Review → accept → dispatch | Confirm incident end separately

The subsequent team specification separated dispatch-queue completion from incident end.

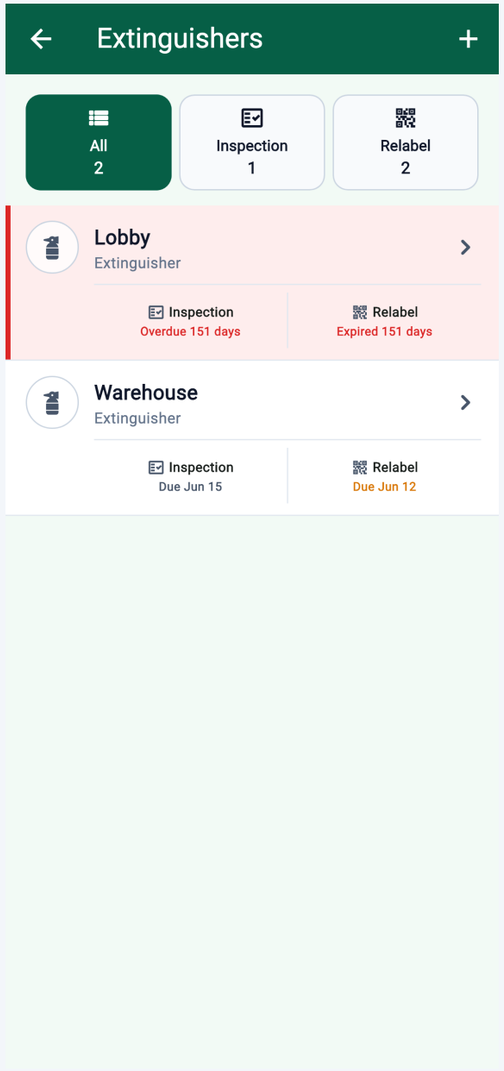

Context. Priority. Next action.

Accepted main UI / September 2026 / fictional demonstration data

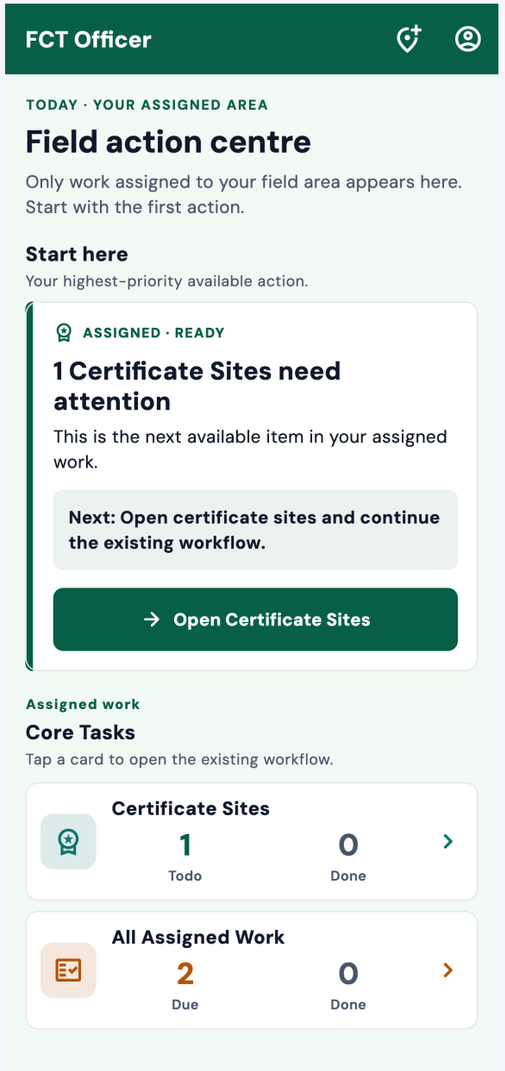

Owner workspace

Which site am I managing?

Extinguisher tasks

What needs attention?

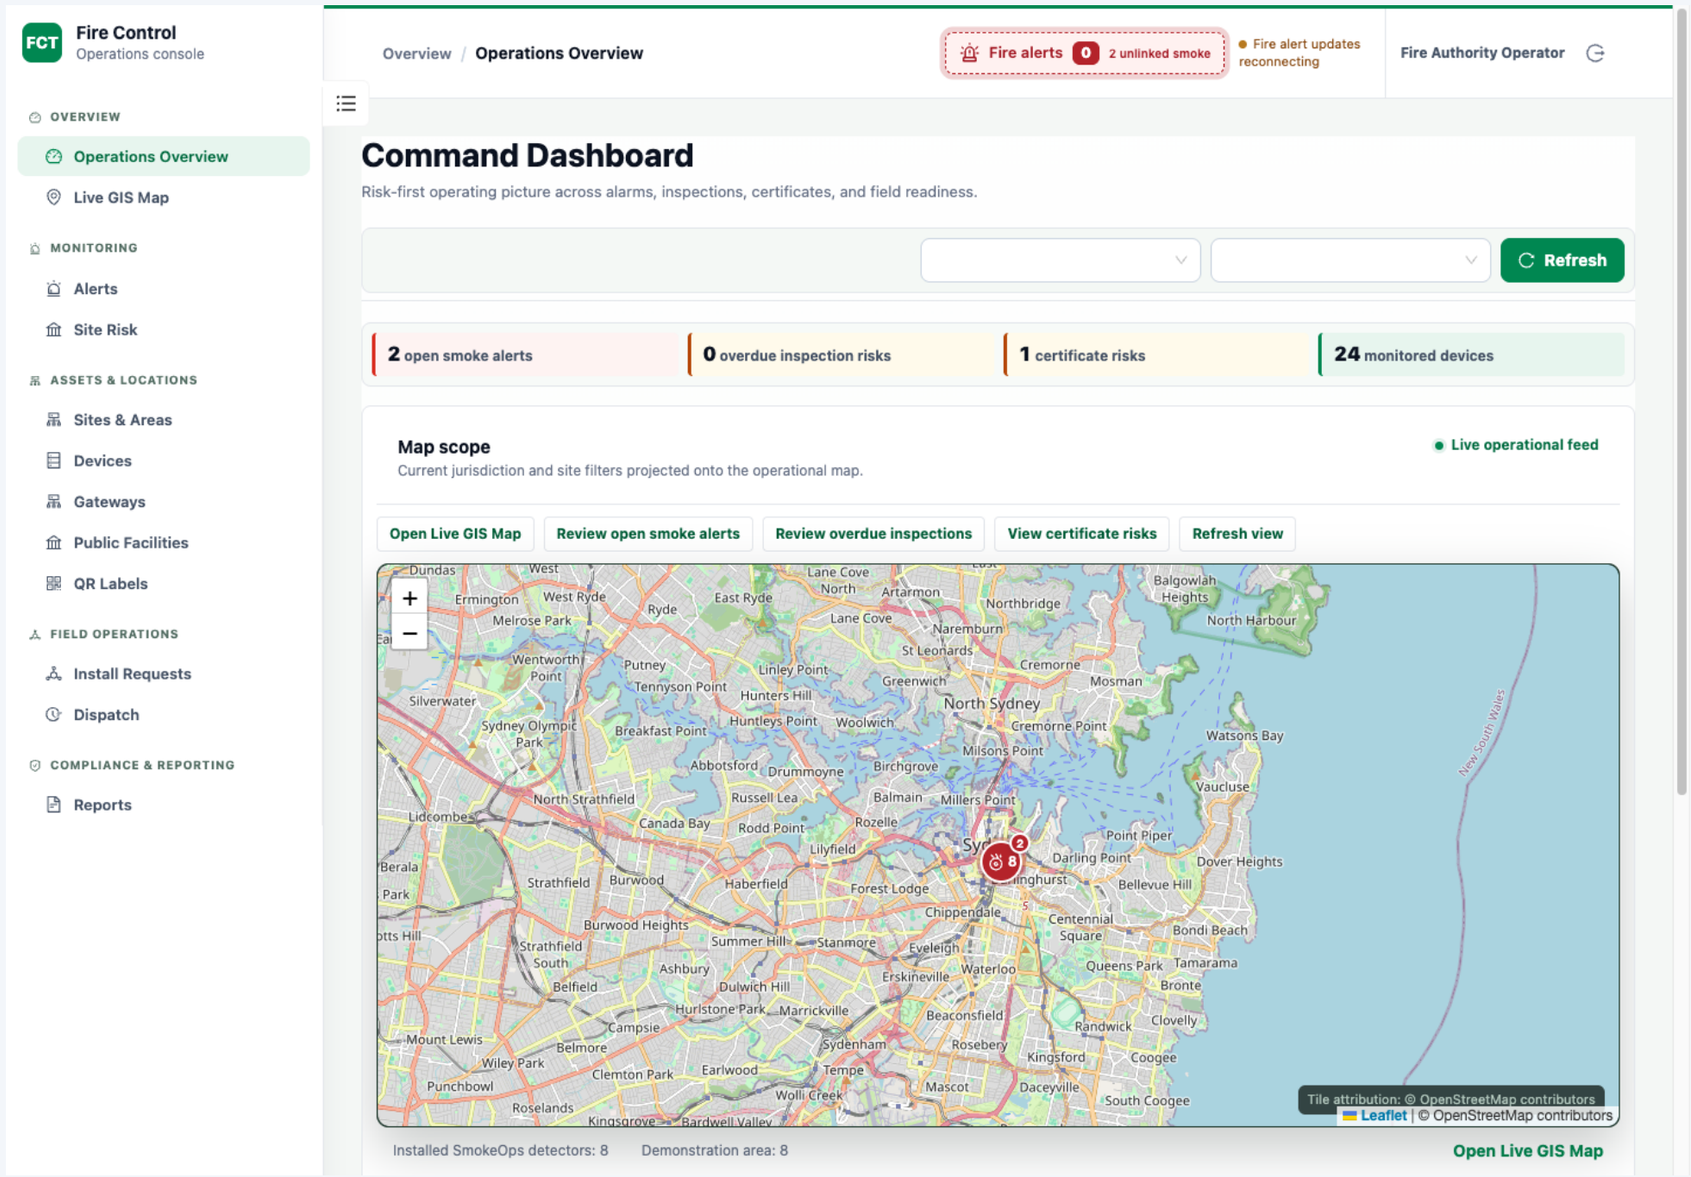

Officer action centre

Which assignment is next?

Team-built interfaces. My review: account/site boundaries, status wording, task hierarchy and acceptance continuity.

Bring the operating picture together.

Filters, risk summaries and map context help frame the next follow-up.

Team-built accepted UI; my review focused on hierarchy, detail panels and follow-up paths.

Public basemap © OpenStreetMap contributors / openstreetmap.org/copyright. Fictional Sydney point and counts.

Carry the context into delivery.

Make a decision, define a check and coordinate the next handoff with technical colleagues.

Clarify

Prepared stakeholder questions; separated account, site and role responsibilities; prioritised complete workflows.

Review AI-assisted work

Reviewed generated proposals and interfaces; challenged unnecessary scope; requested concrete test steps and acceptance checks.

Coordinate

Requested operator guides, coordinated test/build handoffs, and requested a known-working demonstration baseline while preserving later iteration.

WHAT THE RECORD SUPPORTS

A five-person team delivered the platform within a four-month phase and continued iterating. Build handoffs, operator guides, test instructions and workflow revisions show how the work progressed.

Hardware checks and human acceptance remained separate from automated or simulated checks. These records do not establish a completed production rollout or a measured usability improvement.

Contribution and confidentiality

My work: requirements, interaction review and coordination. Team interfaces and engineering/AI implementation are credited accordingly. Diagrams are reconstructions. Customer data, commercial details, QR/encryption, API and security implementation are omitted.

FIELD RESEARCH / PRODUCT DECISIONS / 2026

From the field to a testable direction.

Original field photograph / no people or identifying signage

I conducted three days of field research, then contributed UI, handoff and AI-assisted prototype iteration. The complete user flows, IA and specifications were team deliverables.

Actual Android MVP
Confirmed synthetic demo records

DECISIONS THAT SHAPED THE WORK

Different roles. Different evidence.

RESEARCH SYNTHESIS / REDRAWN FOR THIS CASE

WORKERS

Lower-text input

Graphical cues, scanning, photos

MANAGERS

Useful operating records

Fit existing routines

BANK MONITORING

Identity and data trust

Compare evidence and failure risks

INPUT CONSTRAINT

Some workers faced text-input friction. I brought lower-text approaches into the requirements discussion.

TECHNICAL TRADE-OFF

A shared link can create a blind spot. Compare local collection with GPS/BeiDou fallback by context.

PROTOTYPE SCOPE

I chose Flutter for the April MVP and prioritised cattle, alerts and weight entry with simulated data.

CHECKED IN REVIEW

Navigation visibility, alignment and consistency became concrete iteration items.

NEXT EVALUATION

Test core tasks with each role in context; integrate hardware before claiming field outcomes.

ACADEMIC TEAM WORK / 2025

DECO2200 / INTERACTION DESIGN STUDIO / 2025 S2

One System, One Journey.

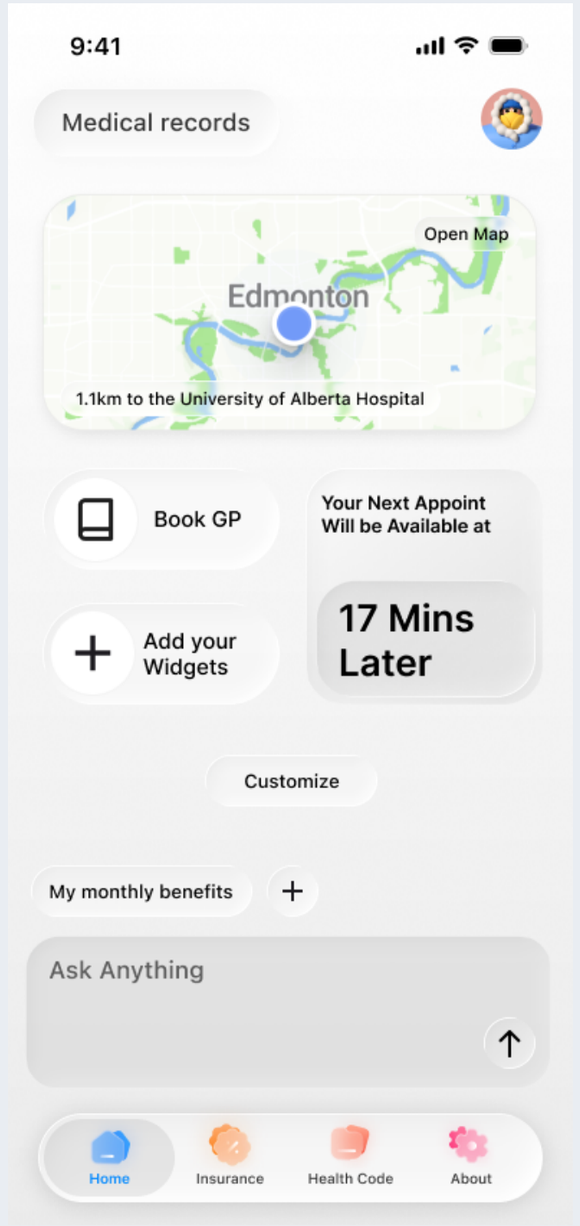

An omni-channel healthcare concept, shown through the team's original Figma screens.

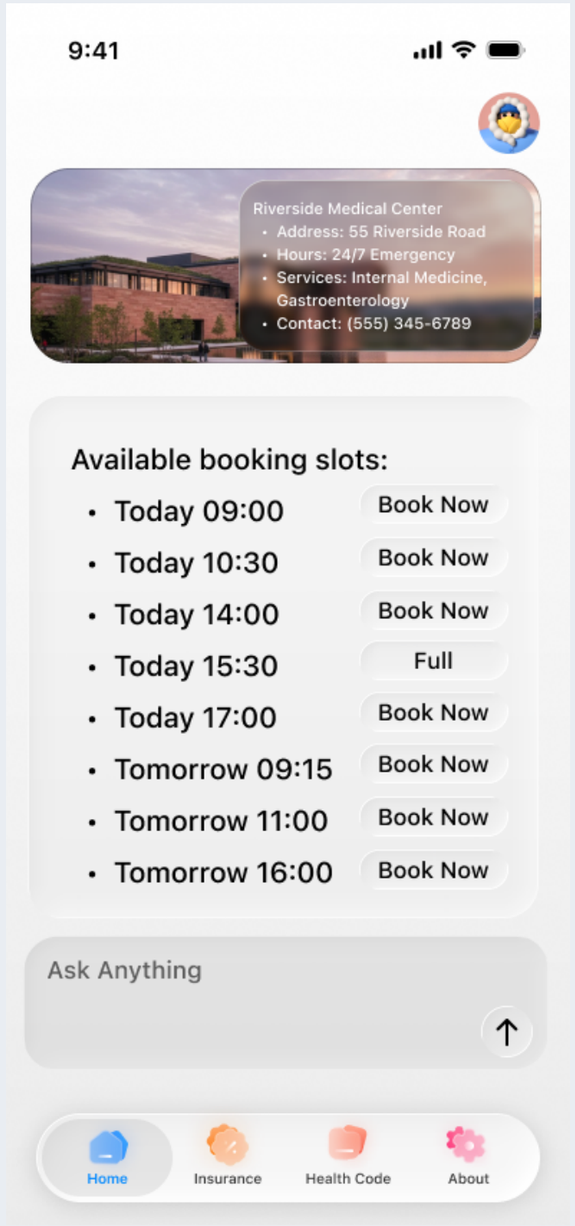

VISUAL STUDY

Soft surfaces, rounded panels and colourful icon accents organise the mobile experience.

MY CONTRIBUTION

I created the Figma interface design for this academic team project. Research and other project work were shared with teammates.

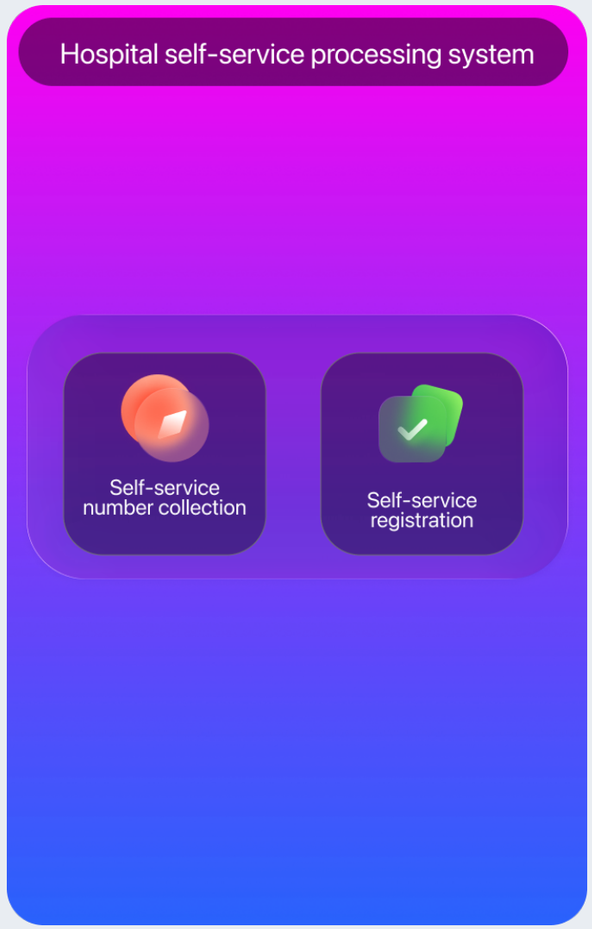

Original Figma exports • academic prototype, not a clinical service

A VISUAL SYSTEM ACROSS TOUCHPOINTS

One journey needs one visual language.

Original kiosk concept / Figma node 353:3581

OBSERVATION FROM THE ARTEFACTS

Mobile and kiosk share expressive icons, but use different surface and colour treatments.

TEACHER FEEDBACK TO CARRY FORWARD

The final assessment recognised promising mobile/tablet interfaces and a refined poster style. It also called for stronger hierarchy, kiosk consistency and accessibility justification.

DESIGN CONTRIBUTION

My Figma work explored a visual language across mobile and kiosk touchpoints. I would carry the assessment feedback into clearer hierarchy, stronger cross-touchpoint consistency and accessibility decisions.

Academic team concept / original Figma interface exports.
